

## ASSIGNMENT-2

### **Project Brief:**

The assignment is about practical application of Tamil Nadu E-system using C language. All of the program's codes were done from the unique ideas of team members and their assumption of the instructions posted in the GCR PDF, and no external E-system code has been referred or used while coding for this program.

### **Team Members:**

Name	Registered number
Merlin Might V S	71762108027
Samuela Abigail Mathew (Team Leader)	71762108039

**NOTE:-** To compile multiple source files (addcandidate.c andotecandidate.c) into single program, we have made respective header files (addcandidate.h andotecandidate.h) to make functions in those source files be available as library functions in those header files. Then those headers are included in the main source file (Assignment 2 E-system Team #Samuela,Merlin.c), and the source files' functions are accessed in the main source file as library functions of respective header files.

## **Short Explanation of the Program:**

When the voting machine is run, it'll first ask to press ENTER key. After pressing it, it'll take the user to welcome screen where 2 menu options will be offered asking if user is a candidate or a voter. If user presses 1, it'll take him/her to candidate module, and if user presses 2, it'll take them to voting module. If some other key is pressed, it'll print error message and show the welcome screen again. The screen will keep getting refreshed/cleared every time user presses a menu option and according to wherever function for clearing screen is applied. The welcome screen offering the above menu options will continue to show up infinite times until the user presses quit button in either candidate module or voting module. All of these are covered in the main source file (Assignment 2 E-system Team #Samuela,Merlin.c) .

### **Task 1 -Candidate module:**

This is made for candidates who are standing/will be standing in the election. It'll offer 3 menu options- Add candidates, View candidates, and Quit. All of these are covered in the source file addcandidate.c

1. When 1 is pressed by user, it'll take them to candidate registration portal. First it'll ask for name of user to check if a candidate with that name already exists in candidate list. If candidate list is not there(empty), it'll create one. If entered name is already in candidate list, it'll say that candidate is already registered and take user back to welcome screen. Suppose entered name is not in candidate list. Then it'll ask user to enter their party name and division number (division number ranges from 1 to 4, and division is basically a constituency). No two candidates belonging to the same party can stand in the same division, and the program will check accordingly. If details entered by user is such that he/she is

trying to stand in the same division where someone else from their same party is already standing, it'll print according error message and will take user back to welcome screen. If no such situation occurs and all the details entered by the user adhere to the rules, it'll generate candidate ID for the newly registered candidate and the details will be stored in the candidate list. Candidate ID is made by taking the first 3 letters of that person's party name, converting those 3 letters to uppercase, and attaching a two digit randomly generated number at the end of those 3 letters. Candidate vote count will be set to zero by default. After registering candidates, it'll print message that candidate has registered successfully and will take user back to welcome screen.

2. When 2 is pressed by user, it'll take them to candidate list portal and display full candidate list and show details like candidate name, ID, party, and division. Candidate votes won't be shown as we have assumed that election hasn't started yet (anyway, I merely followed PDF instructions).
3. When 3 is pressed, it'll print message "good luck for election. Goodbye" and then end the whole program. If any key other than 1,2, or 3 is pressed, it'll print error message and take user back to welcome screen.

## **Task 2 -Voting module:**

This is for the public. It offers 5 menu options- View candidates, Register voter, Vote, View voting results and summary, and Quit. All of these are covered in the source file `votecandidate.c`

1. When user presses 1, it'll take user to view candidate list portal where 3 menu options will be given- view full candidate list, view division-wise candidate list, and view party-wise candidate list, and the user has to press 1,2, or 3 respectively. When user

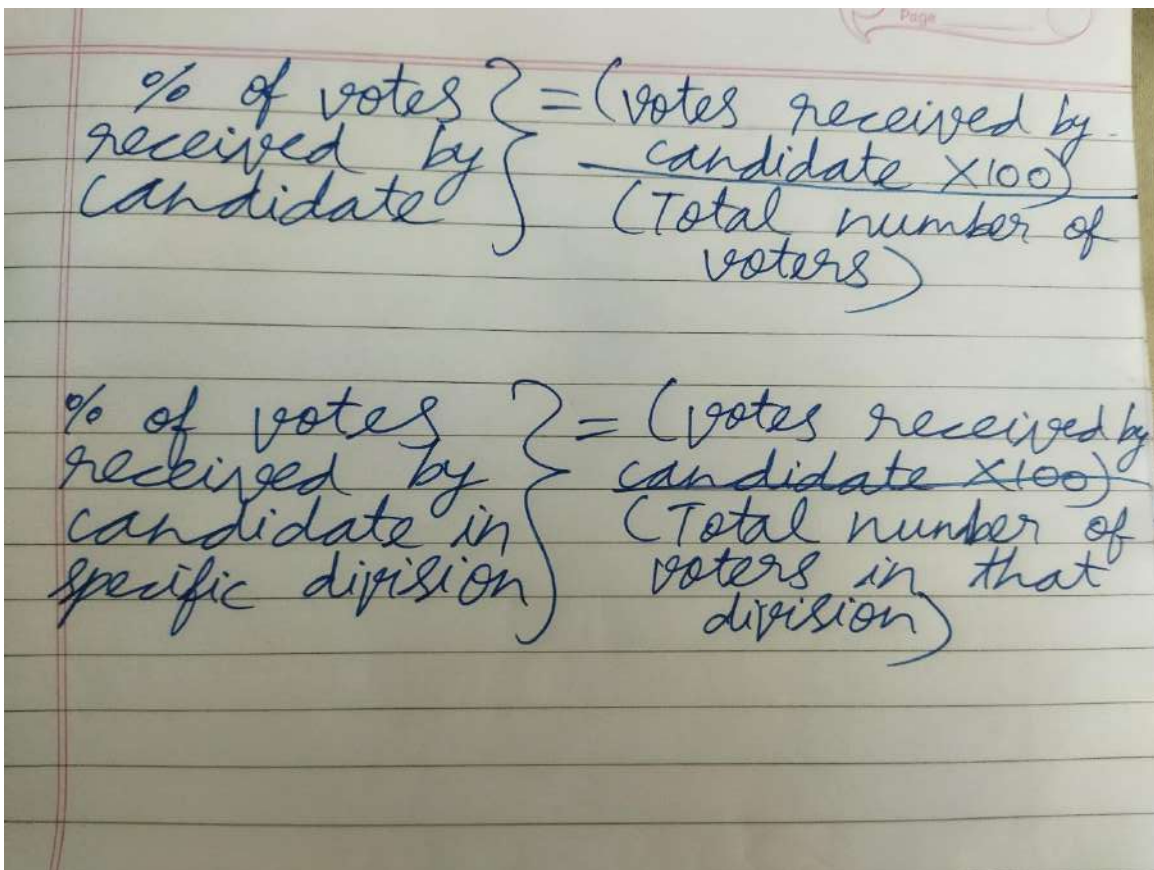

views full list, details of all candidates will be shown where their name, ID, party, division and vote count will be displayed. When user views division-wise list, the program will ask user to enter division number and it'll display details of candidates in those division. If candidate enters wrong division number, it'll print error message and show welcome screen again. When user views party-wise list, it'll ask user to enter party name. If no such party is found in candidate list, it'll say "party not found". If party is found, it'll print list of all candidates belonging to that party. If some other button is pressed, it'll print error message and show welcome screen.

2. When user presses 2, it'll take to voter registration portal. First it'll ask user to enter name, and if name is already present in voter list, it'll say voter is already registered and show welcome screen again. If voter list is empty, it'll create one. If user is not a registered voter, it'll ask for age and division. If age is less than 18 or if entered division number is invalid, it'll print appropriate error message and show welcome screen again. If all entered details are valid, it'll proceed to generate voter ID and store all details in voter list and asks voter to remember their ID while displaying their voter ID. Voter status is set to "N" by default (means voter hasn't voted yet). Voter ID is generated by removing all whitespaces in the voter's name. If no whitespace characters are found in name, it'll attach @EVM# at end of voter name and that is their voter ID. Example- if voter name is Sam, then their voter ID is Sam@EVM# .If voter name is Sam Abi, voter ID will be SamAbi .
3. When user presses 3, it'll take to voting portal. Only a registered voter can vote, and they can vote only once. It'll ask user to enter their voter ID, and it'll check if voter is registered voter by checking if someone with that ID exists in voter list and if it exists, it'll further check if their voting status is "N". If those conditions aren't satisfied, it'll print appropriate error message

and welcome screen will be displayed. If those conditions are satisfied, it'll show candidates' details from voter's division and ask voter to enter name of candidate they want to vote (we are not asking voter to enter ID of candidate they want to vote because there are chances that candidate ID may not be unique). If voter tries to vote for a candidate in another division by entering a candidate name who's standing in a different division, it'll print error message and display welcome screen. The same goes for the situation where voter enters incorrect name of candidate etc. If voter enters name of candidate in his/her division as displayed in the list shown to them, voting status of voter will be changed to "Y" (means they have already voted and can't vote again), and vote count of that candidate will be increased by 1. Both voter list and candidate list will be updated accordingly.

4. When user presses 4, it'll take to voting results and summary portal. It'll display 2 menu options- view voting results of all candidates, and view voting results of candidates in a specific division, for which user has to press 1 or 2 respectively. When 1 is pressed, it'll show number of candidates, number of total votes received, and number of eligible voters. It'll also display details of candidates who got highest and lowest votes in each division along with their full details, and full result list will also be displayed having details like candidate name, ID, party, division, votes received, and percentage of votes received. If user presses 2, it'll ask user to enter division number, and will display voting results and summary similar to above one, but only for that specific division entered by user. If wrong division number is entered, it'll print according error message and welcome screen will be displayed. If invalid buttons are pressed, it'll show error message and take to welcome screen.

**NOTE:-** To calculate percentage of votes received, we have used the below formula based on our assumption that even though not all voters will vote, they too should be considered since they are legitimate voters. So for denominator we are putting total number of voters (since all voters are legitimate, total votes will be considered as equal to total number of voters even if all voters don't vote) instead of total number of votes currently received in the election (in Google, the latter one only is used, but we've used the former one due to our assumptions and varied perspective).

The image shows two handwritten versions of a formula on lined paper. The top version is: 
$$\left. \begin{array}{l} \% \text{ of votes} \\ \text{received by} \\ \text{candidate} \end{array} \right\} = \frac{(\text{votes received by candidate} \times 100)}{(\text{Total number of voters})}$$
 The bottom version is: 
$$\left. \begin{array}{l} \% \text{ of votes} \\ \text{received by} \\ \text{candidate in} \\ \text{specific division} \end{array} \right\} = \frac{(\text{votes received by candidate} \times 100)}{(\text{Total number of voters in that division})}$$

5. When user presses 5, it'll print "Thank you for visiting. Goodbye!", and the whole program will end. If some other

invalid button is pressed, it'll print error message and display welcome screen.

### **Unique Features of the Program:**

- The program will always display real date and time at the top-right corner of the command window.
- All the displayed text will be in different colors to make it look good and easy to read.
- The screen will be cleared automatically when pressing different menu options to make it easy for user to use the E-System machine.
- While registering as voter, if voter's name has no whitespace characters, the unique way at attaching @EVM# at end of voter's name will be implemented to generate voter ID.
- Appropriate validations are done throughout the entire program, and error message is also printed accordingly.
- The program will keep running without crashing, and quit option is given for user to exit program any time.

## Identification of Variables, Constants, and Functions:

Variables/ Constants/ Functions	Identification
<b>struct voters</b>	<p>It is used for registration of voters in register_voter() function, and is a global declaration(although declaring it locally inside register_voter() function is also fine). It is used inside votecandidate.c source file.</p> <p>It's members are-</p> <ol style="list-style-type: none"><li>1. voter_id which is a character array used for storing the voter's ID in the form of string.</li><li>2. voter_name which is a character array used for storing the voter's name in the form of string.</li><li>3. status which is a character datatype member used for storing the status of voter (i.e) whether the voter has voted or not. In register_voter() function, status will be set to N (means not voted) by default.</li><li>4. voter_div is an integer datatype member used for storing division number of voter.</li><li>5. age is an integer datatype</li></ol>

	<p>member used for storing the age of voter.</p> <p>Finally, voter is a variable of struct voters used for getting voter information during voter registration.</p>
<b>red(), yellow(), green(), blue(), purple(), cyan()</b>	These are void type functions used to get colored text in red, yellow, green, blue, purple, and cyan color respectively.
<b>screen_clear()</b>	It is a void type function used for clearing screen using system("cls") in TurboC compilers. To clear screen in GCC/G++ compilers, use system("clear") instead.
<b>real_clock()</b>	It is a void type function used for displaying real/actual date and time.
<b>full_candidate_list()</b>	It is a void type function used for displaying full candidate list in votecandidate.c source file.
<b>div_list()</b>	It is a void type function used for displaying division-wise candidate list in votecandidate.c source file.
<b>div_flag</b>	It is an integer datatype variable used in div_list() and div_result()

	functions and is used to check whether division number entered by user is correct or not. It's initialized to 1, and if entered value of division is from 1 to 4, it'll be reset to 0. If it remains set to 1, it'll print error message.
<b>division</b>	It is a character datatype array used for storing the input division number by user in the form of string in a few functions throughout the entire program.
<b>line</b>	It is a character datatype array usually used in many functions of the program to store line of respective text file in the form of a string, one at a time.
<b>buf, buffer</b>	They are character datatype arrays usually used in many functions of votecandidate.c and addcandidate.c respectively to store the line in respective text file till ; is encountered in the form of a string, one at a time.
<b>token, value</b>	They are character datatype pointers usually used in many functions of votecandidate.c and addcandidate.c respectively to store a particular part of the line in respective text file broken by

	strtok() function in the form of a string, one at a time.
<b>struct Candidate</b>	<p>It is usually used in many functions of votecandidate.c to store candidate details after getting them from respective text files.</p> <p>It's members are-</p> <ol style="list-style-type: none"> <li>1. Cand_id which is a character array used for storing the candidate's ID in the form of string.</li> <li>2. Cand_name which is a character array used for storing the candidate's name in the form of string.</li> <li>3. Cand_par which is a character datatype member used for storing the party name of candidate.</li> <li>4. Cand_div is an integer datatype member used for storing division number of candidate.</li> <li>5. Cand_count is an integer datatype member used for storing the number of votes received by that candidate.</li> <li>6. Cand_per is a float datatype member used for storing the percentage of</li> </ol>

	<p>votes received by that candidate.</p> <p>Finally, Cand is an array of structures used for storing all candidates' information during.</p>
<b>par_list()</b>	It is a void type function used for displaying party-wise candidate list in votecandidate.c source file.
<b>par_flag</b>	It is an integer datatype variable used in par_list() function and is used to check whether party name entered by user exists or not. It's initialized to 1, and if entered party name is found in the candidate list text file, it'll be reset to 0. If it remains set to 1, it'll print error message.
<b>party</b>	It is a character datatype array used for storing the input party name by user in par_list() function.
<b>view_candidates()</b>	It is a void type function in votecandidate.c which offers the menu to choose to view list of all candidates and list of candidates in a particular division and party.
<b>register_voter()</b>	It is a void type function in votecandidate.c through which a

	<p>voter is allowed to register for voting. It'll collect voter details, check if the person is eligible to become a voter, and after verifying he/she is eligible to register as voter, it'll store their details in voter table (list of voters text file) and generate their unique voter ID using which they can vote in the future. If voter is not eligible to vote, it'll print appropriate error message.</p>
<b>dup_flag</b>	<p>It is an integer datatype variable used in register_voter() and add_cand() functions, and is used to check whether the name entered by user exists or not (i.e) if the person is already a registered voter/registered candidate. It's initialized to 0, and if entered name is found in the voter list/candidate list text file, it'll be reset to 1 and it'll print error message.</p>
<b>no_space_flag</b>	<p>It is an integer datatype variable used in register_voter() function, and is used to check whether the name entered by user has space or not. It's initialized to 1, and if entered name is found to have space, it'll be reset to 0. If it remains set to</p>

	1, while generating unique voter ID it'll signal the program to concatenate another string which is @EVM# stored in character array called str at the end of the inputted name, and that will be the voter ID of that person.
<b>voting()</b>	It is a void type function inotecandidate.c which allows registered voters to vote once through their voting ID for any candidate in their division. It'll do appropriate validations and print error messages if candidate is not registered voter/ has already voted/ doesn't enter correct name of candidate he/she wants to vote.
<b>i,j,k</b>	These are integer datatype variables mostly used for iteration in looping statements throughout the entire program.
<b>id</b>	It is a character datatype array used for storing the input voter ID in voting() function. It is used to check if the input voter ID is in the voter list or not i.e. if the voter is a registered voter or not.
<b>name</b>	It is a character datatype array

	used for storing the input candidate name to whom the voter wishes to vote in voting() function. It is used to check if the input candidate name is valid or not.
<b>vote_flag</b>	It is an integer datatype variable used in voting() function. It is initialized to 1, and is used to check if the voter is eligible to vote. If voter's status is "N" and their ID is also found in list, vote_flag is reset to 0. Otherwise it'll remain as 1 and will not allow user to vote.
<b>voter_is</b>	It is an integer datatype variable used in voting() function. It is used to store position of voter in voter list so that it can be used to change status of voter from "N" to "Y" in the list later on after they have successfully voted.
<b>val</b>	It is an integer datatype variable used in voting() function. It is used to increment the vote count of candidate (since Cand[i].Cand_count will be in the form of a string) to whom the voter has given their vote to.
<b>voted</b>	It is an integer datatype variable used in voting() function. It is

	initialized to 0, and is used to check if voter has successfully voted or not. If voter has successfully voted, it'll be reset to 1. If it remains set to 0, then voter has not voted successfully due to not adhering to voting rules, and their status will remain as "N".
<b>voting_result()</b>	It is a void type function in votecandidate.c which allows the user to view voting results and summary and shows 2 menu options. If user wants to view results of all candidates (menu option 1), it'll call full_result() function. If user wants to view election results in a specific division(menu option 2), it'll call div_result() function.
<b>full_result()</b>	It is a void type function in voting_result() function which allows the user to view voting results and summary of all candidates.
<b>total_cand</b>	It is an integer datatype variable initialized to 0 and used in full_result() function, and is used to store the value of total number of candidates in candidate list.

<b>total_voter</b>	It is an integer datatype variable used in full_result() function, and is initialized to 0. It is used to store the value of total number of voters in voter list.
<b>total_votes</b>	It is an integer datatype variable used in full_result() and div_result() functions, and is initialized to 0. It is used to store the value of total number of votes received by all candidates in candidate list.
<b>highest1, highest2, highest3, highest4</b>	These are integer datatype variables used in full_result() function, and are initialized to -1. They are used to compare and check which candidate has the highest number of votes in division 1,2,3 and 4 respectively.
<b>lowest1, lowest2, lowest3, lowest4</b>	These are integer datatype variables used in full_result() function, and are initialized to 1. They are used to compare and check which candidate has the lowest number of votes in division 1,2,3 and 4 respectively.
<b>struct winner</b>	It is used for storing details of candidate who gets the highest number of votes in full_result() and div_result() functions. It's members are similar to struct

	<p>Candidate. Variables declared using struct winner datatype are win1, win2, win3, win4, and win.</p>
<b>struct last</b>	<p>It is used for storing details of candidate who gets the lowest number of votes in full_result() and div_result() functions. It's members are similar to struct Candidate. Variables declared using struct last datatype are loss1, loss2, loss3, loss4, and loss.</p>
<b>struct Voter</b>	<p>It is similar to struct voters, but is used locally inside many functions ofotecandidate.c source file. It's members are V_id, V_name, V_age, V_div, and V_status, and the array containing these structures is V. This is actually a shorter form of struct voters in terms of members' and variable's names since the names of members and variables are much lengthier compared to those in struct Voter. We haven't replaced struct voters with struct Voter for the sake of clarity since struct voters can be easily understood because of the detailed names given to it's members and variables.</p>

<b>div_result()</b>	It is a void type function in voting_result() function which allows the user to view voting results and summary of candidates in a specific division after user inputs division number in command window.
<b>total_cand_div</b>	It is an integer datatype variable initialized to 0 and used in div_result() function, and is used to store the value of total number of candidates in candidate list from the division entered by user.
<b>total_voter_div</b>	It is an integer datatype variable used in div_result() function, and is initialized to 0. It is used to store the value of total number of voters in voter list from the particular division inputted by the user.
<b>highest, lowest</b>	These are integer datatype variables used in div_result() function, and are initialized to -1 and 1 respectively. They are used to compare and check which candidate got the highest and lowest votes respectively in the division inputted by user.
<b>voter_menu()</b>	It is a void type function in votecandidate.c which will be

	called in the main source file, and all other functions of votecandidate.c will be executed through this function only.
<b>option</b>	It is an integer datatype variable usually used throughout the program to get input on which menu option the user has chosen.
<b>add_cand()</b>	It is a void type function in addcandidate.c , and is used for registration of candidates.
<b>num, upper, lower, random</b>	All of these are used in generation of random number during creation of candidate ID in add_cand() function. num, upper, and lower are integer datatype variables, and random is a character array. While generating random number, lower and upper are used to assign lower and upper limits respectively of the range within which the random number is generated. Here, lower and upper are initialized to 10 and 99 respectively. The generated random number is assigned to num, and it's value is copied to random as a string through sprintf() library function.

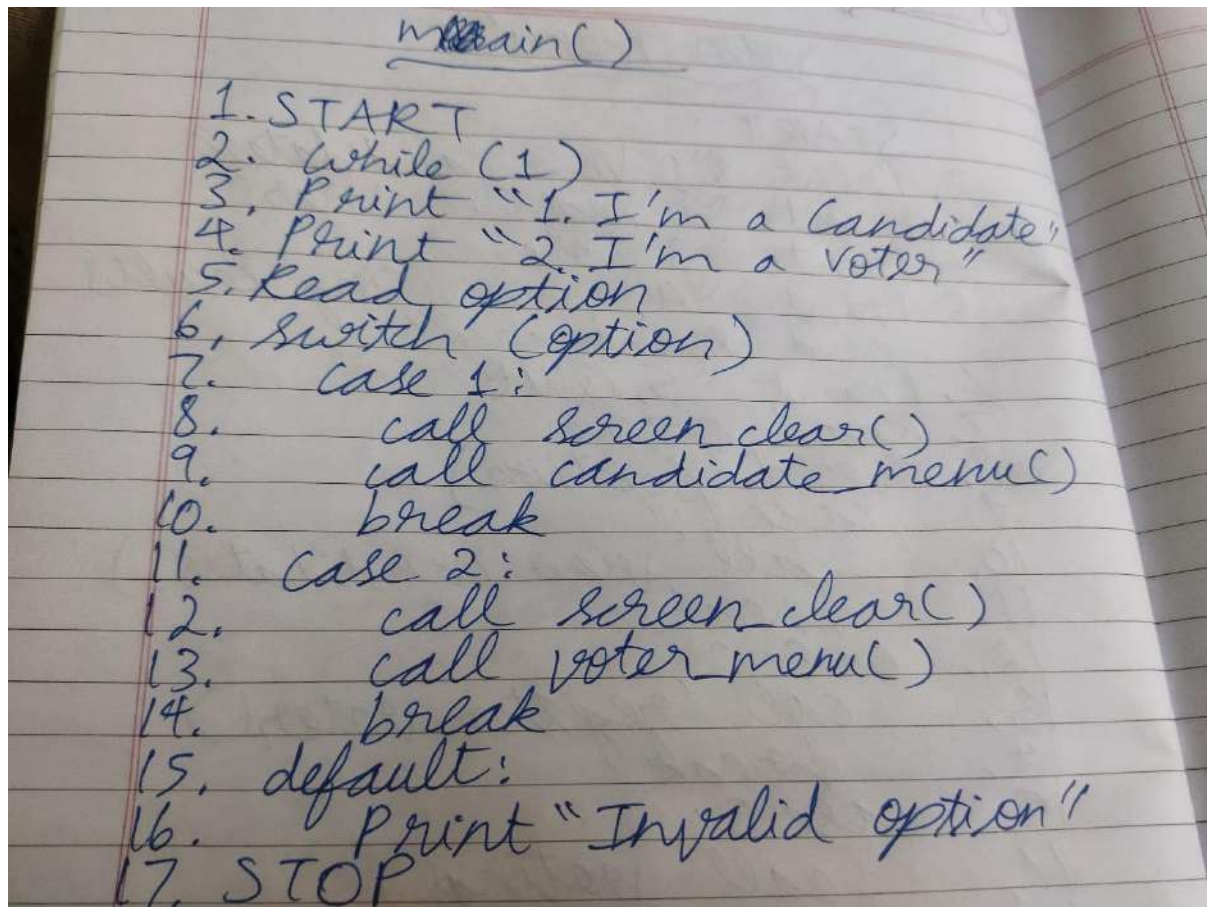

<b>view_cand()</b>	It is a void type function used in addcandidate.c to view full candidate list.
<b>candidate_menu()</b>	It is a void type function used in addcandidate.c through which all other functions of addcandidate.c are executed, and this is the function that'll be called into the main source file to execute the functions in addcandidate.c source file.
<b>temp</b>	It is a character datatype array used in some places of the program to temporarily copy some string into itself.
<b>nope</b>	It is an integer datatype variable which is initialized to 0, and used in add_cand() function to check if someone from the same party as the registering candidate is already standing in the same division as that candidate. If this is true, nope is reset to 1 and it'll not allow registration of that candidate.

### Peer Assessment:

Name	Task done
Merlin Might V S	addcandidate.c file, addcandidate.h file, red() function, blue() function, green() function, yellow() function, purple() function, cyan() function
Samuela Abigail Mathew	Compiling all codes into single program, Assignment 2 E-system Team #Samuela,Merlin.c file, otecandidate.c file, otecandidate.h file, real_clock() function, screen_clear() function, generation of unique candidate ID in addcandidate.c file, performing validation to see if candidates from the same party are standing in the same division in addcandidate.c file

## Pseudo Code Algorithm:

### main() function

```
main()
1. START
2. While (1)
3. Print "1. I'm a Candidate"
4. Print "2. I'm a Voter"
5. Read option
6. Switch (option)
7.   case 1:
8.     call screen clear()
9.     call candidate menu()
10.    break
11.  case 2:
12.    call screen clear()
13.    call voter menu()
14.    break
15.  default:
16.    Print "Invalid option"
17. STOP
```

### For task 1:-

For viewing full candidate list

```
full-candidate-list()
1. START
2. If fptr <- fopen("candidate-list.txt")
   <- NULL
3. Print "candidate list is empty"
4. Print("\n CANDIDATE ID \t \t
   NAME \t \t \t PARTY NAME \t \t DIVISION
   \t VOTES \n")
5. while fgets(line, sizeof(line), fptr)
6.   If fscanf(fptr, "%[^.]\n", buf)
7.     token <- strtok(buf, ".")
8.   If feof(fptr)
9.     break
10.  while token != NULL
11.    strcpy(cand[i].cand_name,
      token)
12.    token <- strtok(NULL, ".")
13.    strcpy(cand[i].cand_par, token)
14.    token <- strtok(cand[i].cand_id,
      token)
15.    token = strtok(NULL, ".")
16.    cand[i].cand_div <- token
17.    token <- strtok(NULL, ".")
18.    cand[i].cand_count <- token
19.    token <- strtok(NULL, ".")
20.    Print cand[i].cand_id,
      cand[i].cand_name, cand[i].cand_par,
      cand[i].cand_div, cand[i].cand_count
21.    i++
22.    fclose(fptr)
23. STOP
```

## Candidate registration

void add\_cand() function

START

Declare char temp[5] = " ", random[2], line[500]

Declare char buffer[1024]

~~Initialize~~ int dup-flag = 0, nope = 0, i = 0, j, k, num,

String print to file copy integer to string

Concatenating temp with random to get alphanumeric candidate ID

Print Your candidate ID is

purple() function

print candidate id

file close fp

$fp = fopen("candidate\_list.txt", "a")$

initialize count equal to 0

~~Read~~ <sup>Read</sup> file name, party, candidateId, division, count

yellow() function

Print candidate registered successfully!

file close fp

END.

## Candidate menu function

```
Void candidate_menu () function
START
Declare integer option
blue() function
Print Welcome to Tamilnadu State Electoral Commission E-system
real-clock() function (calling to display time)
cyan() function
Print t1. Add candidate
Print t2. View candidate
Print t3. Quit
Print Please select a choice
yellow() function
Print Enter your choice
Read option
Switch case based on option
Case 1
    add_cand()
    break
Case 2
    view_cand()
    break
Case 3
    green() function
    Print Good luck for the election. Goodbye
    exit(0)
    break
Default
    red() function
    Print Invalid selection, Please try again
END
```

## For task 2:-

### For viewing full candidate list

full\_candidate\_list()

1. START
2. If  $fptr \leftarrow fopen("candidate\_list.txt")$   
     $\leftarrow NULL$
3. Print "candidate list is empty"
4. Print ("\\n CANDIDATE ID \\t \\t  
NAME \\t \\t \\t PARTY NAME \\t \\t DIVISION  
\\t VOTES \\n")
5. while  $fgets(line, sizeof(line), fptr)$
6.   If  $fscanf(fptr, "%[^.]", buf)$
7.      $token \leftarrow strtok(buf, ".")$
8.   If  $feof(fptr)$
9.     break
10.   while  $token \neq NULL$
11.      $strcpy(cand[i].cand\_name, token)$
12.      $token \leftarrow strtok(NULL, ".")$
13.      $strcpy(cand[i].cand\_par, token)$
14.      $token \leftarrow strtok(cand[i].cand\_id, token)$
15.      $token = strtok(NULL, ".")$
